

Print Office uses U-Upload to offer file upload capabilities

U-Upload provides easy-to-use file transfer services for a quick printer

Print Office is a quick printer catering to the emerging market of digital printing in Charlotte, North Carolina. Print Office needed an easy and quick way for customers to send their job orders and print files. This was imperative in order to cater to the quick print market, where customers have rush-order jobs and quick turn around times. One way of accomplishing this was to use the internet to send electronic work files, instead of couriering CDs to Print Office. To help them accomplish this, Print Office turned to Unlimi-Tech Software. To solve the requirements of Print Office, Unlimi-Tech Software implemented U-Upload into Print Office's website. U-Upload is a file upload applet that runs on the customer's web browser and uploads files to a FTP server. Because U-Upload is a JAVA™ based solution, it can be run on any web-browser supporting JAVA™ plug-ins on Macs or PCs. U-Upload, unlike traditional FTP software, requires no installation or configuration from the end-user's part.

With U-Upload supporting file transfers for Print Office, customers now browse to the home page. They click on "Upload files" to open a new browser window. Within the browser window they can submit print order information through a web-form. This form captures their contact details, the type of print job and the delivery date. Once the form has been filled, the customers are requested to upload their files.

This is when the U-Upload applet is initialized within the browser window. The applet opens the familiar Windows dialogue box, where the users select the files to upload. Entire folders can be easily compressed and uploaded with a touch of a single button. Once the files have been selected all the users need to do is click on upload. U-Upload offers advanced functionality such as a redirect page based on the success of the uploaded file and supports the "resume" command. The print operator at Print Office receives the uploaded file and the job specifications all in one package. Because it's so simple and easy to integrate U-Upload into an existing web, it proves to be an ideal solution for web masters who wish to add file upload capabilities. By implementing U-Upload into their existing web infrastructure, Print Office has continued to be competitive in the quick print market.

"We are impressed by the functionality of U-Upload and its ability to integrate with our existing web-infrastructure. Using U-Upload we have made it as simple as possible for our clients to interact with us through the web. We are very pleased with the results."
